

Weekly Progress Report

Name: Shairha May B. Ejares

Role: Backend

Project: Attendance Management System (Choyens_AMS_DBTC)

Week of: May 15, 2026

What was achieved last week?

- Successfully pushed backend code to the Backend branch on GitHub
- Implemented CRUD Operations for Courses
- Added foreign key validation in CourseController to check if a TeacherId exists before saving a Course
- Fixed the timestamp with time zone vs timestamp without time zone error in DashboardController by replacing DateTime.Today with DateTime.UtcNow.Date
- Resolved Git branch issues and confirmed remote origin is correctly connected to GitHub

What is the focus for today?

- Continue debugging and testing backend API endpoints via Swagger
- Ensure all controllers (Course, Teacher, Attendance, Dashboard) are working correctly
- Sync the Backend branch with main to avoid future merge conflicts

What blockers exist?

- Foreign key constraint error when creating Courses without an existing Teacher in the database
- PostgreSQL timestamp type mismatch causing exceptions in the Dashboard stats endpoint
- Git branch confusion causing delays in pushing updates

What went well?

- Successfully identified and fixed the foreign key violation error
- Git remote origin was already correctly configured
- Dashboard controller was debugged and the timestamp issue was resolved
- Code is being consistently committed and pushed to the correct branch

What didn't go well?

- Encountered repeated Git errors due to being in the wrong directory
- The Backend branch is currently **22 commits behind main**, which may cause merge conflicts later
- Teachers table was empty, causing all Course creation attempts to fail during testing

What should we start doing?

- Seed the database with initial data (Teachers, Courses) for easier testing
- Validate all foreign key relationships before saving any entity
- Regularly sync the Backend branch with main to stay up to date

What should we continue doing?

- Following the feat/fix/update/docs commit message format for clear history
- Testing all endpoints through Swagger before merging
- Communicating branch progress with the team regularly
